

Policing 2014

Links between deprivation and confidence in the Police in NI

Summary Report of Findings

 MillwardBrownUlster

Background

- The Northern Ireland Policing Board (the Board) undertakes a range of surveys and research activity to establish public perceptions of the Board, Policing and Community Safety Partnerships (PCSPs) and the delivery of policing by the PSNI. The Policing Board uses this research activity to inform its work and assist with the assessment of public satisfaction with the performance of the PSNI, PCSPs and the Board.
- The Board commissioned Millward Brown Ulster to undertake 3 elements of a programme of research within the theme of “Confidence in Northern Ireland Policing”.
- This report addresses ‘the links between deprivation and confidence in the police in NI’.

Methodology and Sample

- Questions were included on three waves of the Millward Brown Ulster Omnibus Survey.
- Fieldwork was conducted between late January and early March 2014.
- Interviewing conducted face-to-face by means of HAPI (Handheld Assisted Personal Interviewing).
- Following the initial random selection of a total of 135 sampling points over the three waves, a quota sampling methodology was utilised.
- Final sample of 3054 was weighted to be representative of NI 16+ population in terms of gender, age, social class, religion and region. Bases shown throughout are unweighted bases.
- Fieldwork was conducted by members of the Millward Brown Ulster Interviewer Panel.
- All research conducted in compliance with the international standard ISO 20252 : 2012.
- More details of the methodology, including sampling and the questionnaire in Appendices.

Sample Profile and Social Grade Classification:

Social Grade Classification – based on occupation of the Chief Income Earner in household

- AB – Upper/Middle Class
- C1 – Lower Middle Class
- C2 – Skilled Working Class
- D – Other Working Class
- E – Other (those entirely dependent on the state long term due to sickness, unemployment, pensioners)

Sample Profile:

Deprivation Decile

Location

Policing District

Findings

Respondents were asked to what extent they agreed or disagreed with a series of statements relating to confidence

Q. To what extent do you agree or disagree...

That the local police in your area can be relied on to be there when you need them?

That the local police in your area would treat you with respect if you had contact with them?

That the local police in your area treat everyone fairly regardless of who they are?

That the local police in your area can be relied on to deal with minor crimes?

That the local police in your area understand the issues that affect this community?

That the local police in your area are dealing with the things that matter to this community

Taking everything into account, I have confidence in the police in this area

Confidence in police in area: Overall Summary

- Of all of these (statements above) respondents are most likely to agree that the *'local police in their area would treat you with respect if you had contact with them'*, with 3 in 4 (75%) tending to agree or strongly agree (21% strongly agree) - (see slide 8).
- This level of agreement is significantly more than that seen for any of the other measurements, the next most likely being *'treat everyone fairly regardless of who they are'* with just over 3 in 5 agreeing (63%).
- Agreement is lowest when asked about views on whether or not the local police *'are dealing with the things that matter to this community'*, *'can be relied on to be there when you need them'* and *'can be relied on to deal with minor crimes'*. Less than 3 in 5 agree strongly or even tend to agree with these sentiments, with 1 in 5 (20%) actually disagreeing with the latter two measures.
- Overall, just over 3 in 5 (63%) at least tend to agree that they *'have confidence in the police in this area'*.
- There is also a clear relationship between each of the measures and the overall confidence measure, with those agreeing that they are confident overall much more likely to agree with each measure. (see slide 9).
- Throughout the report the highest and lowest figures are depicted where appropriate as follows:

Largest total agree

Largest total disagree

Confidence in Police

By Key Demographics

 MillwardBrownUlster

Confidence in Police

By key Demographics

- ABC1's (middle class) are more likely than other socio-economic groups, especially those from socio-economic groups DE (unskilled working class and others - see sample breakdown and explanations of social grade in methodology) to agree with all seven statements (see slides 12/14/16/18/20/22 & 24).
- Protestants and those not claiming to be either religion, tend to be slightly more likely to agree than Catholics, across all measures.
- In terms of difference in attitudes across the different Policing Districts, certain patterns do exist across many of the measures. Those living in District B (South & East Belfast) generally have a relatively high opinion of the police in their area, more likely than others to agree with many of the statements with a few notable exceptions..(see slides 13/15/17/19/21/23 & 25).
 - Those living in District F (Cookstown/Omagh/Fermanagh/Dungannon) are more likely to agree that the local police *would treat you with respect if you had contact with them* or that they *treat everyone fairly regardless of who they are* or indeed that overall they *have confidence in the police*.
- In contrast those living in District A (North & West Belfast) tend to have the poorest opinions. The exception being agreement with the statement that Local Police in your area would treat you with respect if you had contact with them where two districts scored slightly lower on this sentiment.
 - Those living in District H (Coleraine/Ballymoney/Moyle/Ballymena/Larne) are least likely to agree that the local police *would treat you with respect if you had contact with them*;
 - Those living in District G (Derry/Limavady/Strabane/Magherafelt) are least likely to agree that the local police *understand the issues that effect this community*.

 [Base: All Respondents n=3054]

Overall Confidence in Police

Young Males

- The next chart (see slide 27) examines confidence levels amongst young males.
- Overall confidence is slightly lower amongst young males than for the rest of the population.
- In particular, overall confidence is lower amongst young males from the Catholic community, particularly Catholics living in urban areas, and those in socio-economic groups DE, primarily those not in work or education.

Overall Confidence in the police in your area:

**Mean Scores (Strongly agree=5 to Strongly disagree=1)

Confidence in Police

By Deprivation Deciles

 MillwardBrownUlster

Confidence in Police By Deprivation Deciles

- Respondents were coded into a deprivation decile based on their postcode.
- Analysis by deprivation decile, shows clearly that those in the most deprived deciles, 1 and 2, but particularly those in the most deprived decile are less likely to agree across all of the measures of confidence (see slides 31-37).
- Conversely those in the least deprived deciles, again particularly those in decile 10, are more likely to agree with all measures of confidence than those in lower deciles.
- However, while there is a distinct difference between those in the extreme deciles, there is no linear relationship across the deciles in between, with those in decile 6 just as likely to agree as those in decile 10, the least deprived, with each of the statements about confidence in local police.
- The biggest difference between the deciles can be found with regards to views on *local police in your area treat everyone fairly regardless of who they are*, with a divergence of 38% between Decile 1 where respondents are least likely to agree (39% agreeing) and the deciles where agreement is likely to be highest, both decile 10 (77% agreeing) and decile 6 (77% agreeing).
- This was followed by *local police in your area are dealing with the things that matter to this community*, with a divergence of 32% in overall agreement between those living in the most deprived area, decile 1 (38% agreeing) and decile 10 (69% agreeing) and decile 6 (70% agreeing).

Confidence in Police By Deprivation Deciles

- It was seen above that the biggest difference in views across the deciles occurs in relation to the how the police are perceived to treat everyone regardless of who they are, however in contrast, it is when asked about their perceptions of how they thought they would be treated if they had contact with the local police in their area that the differences are smallest.
- And it is on this measure that those in both decile 1 and 2 are the least likely to disagree (as opposed to those in decile 1 areas being less likely than any other decile to agree as seen in other measures).
- The gap between views on this measure is just over 20%, with 86% in decile 10 agreeing and 88% in decile 6 compared to 64% in decile 2 and 65% in decile 1.

Confidence in Police

Correlation Analysis - Overall

 MillwardBrownUlster

Confidence in Police

Correlation Analysis - Overall

- Correlation analysis was conducted on the data to examine the inter-relationships between the measures and to gauge which have the greatest impact on overall scores. A correlation of at least 0.4 is considered strong.
- Hence all of the individual measures have a strong correlation with the overall confidence measure but some are stronger than others. In order of strength of correlation these are as follows ... (see slide 40).
 - *The local police in your area can be relied on to be there when you need them;*
 - *The local police in your area would treat you with respect if you had contact with them;*
 - *The local police in your area treat everyone fairly regardless of who they are;*
 - *The local police in your area can be relied on to deal with minor crimes;*
 - *The local police in your area understand the issues that affect this community;*
 - *The local police in your area are dealing with the things that matter to this community.*

Correlation with Overall Confidence: The figures below show the level of correlation between all the individual measures and the overall level of confidence. A correlation of at least 0.4 is considered strong, hence all of the individual measures have a strong correlation with the overall confidence measure. These are shown in order below with *the local police in your area can be relied on to be there when you need them* showing the strongest correlation and hence relationship with overall confidence.

Confidence in Police

Correlation Analysis by key Demographics and deprivation

 MillwardBrownUlster

Confidence in Police

Correlation Analysis by key Demographics and deprivation decile

- However, correlations between different demographic groups such as region, social class (see definitions in methodology), religion and deprivation decile and the individual and overall confidence measures are much less robust and significant but some patterns can be seen including ... (see slides 44-47):
 - There is a negative correlation between those in the two most deprived areas and all measures including overall confidence and between those in the next two most deprived areas for most measures;
 - There is a conversely positive correlation between those in the three least deprived areas and the two areas in the middle and all measures;
 - There is a negative correlation between District A and all the measures, albeit very weak for some;
 - The correlation is positive across all measures for District B;
 - Correlations are generally even weaker and very mixed depending on the measure across the other Districts;
 - There is a positive correlation between social classes ABC1 and all measures while the correlation was negative for those in socio-economic groups C2 and DE;
 - The correlation is negative, and generally stronger amongst Catholics compared to Protestants and others across all measures;
 - There is positive correlation between those not stating they are Protestant or Catholic on all measures and between Protestants for 6 out of 7 measures.

Confidence in Police

Correlation Analysis by key Demographics and deprivation decile

- However, correlations between different demographic groups such as region, social class, religion and deprivation decile and the individual and overall confidence measures are much less robust and significant but some patterns can be seen including contd:
 - In terms of gender again the correlation is not strong but it was negative for males;
 - Correlation was positive for those aged over 65 for all measures while it was negative for all but one measure amongst those aged under 25;
 - Correlations were mixed between the other age groups and generally weaker.

Correlations with Deprivation Deciles: Correlations of 0.4 are considered relatively strong hence the figures below do not demonstrate a very strong relationship between deprivation and confidence measures. However there is an emerging pattern, showing a negative relationship, albeit not very strong, between most measures of confidence in the police and living in an area of higher deprivation (deciles 1 to 4 where 1 is the most deprived). This is compared to a weak but positive relationship between confidence measures and those living in areas of lower deprivation (especially deciles 5 & 6 and 8 to 10 where 10 is least deprived)

1 = Most deprived to 10 = Least deprived	The local police in your area can be relied on to be there when you need them	The local police in your area would treat you with respect if you had contact with them	The local police in your area treat everyone fairly regardless of who they are	The local police in your area can be relied on to deal with minor crimes	The local police in your area understand the issues that affect this community	The local police in your area are dealing with the things that matter to this community	I have confidence in the police in this area

Correlations of 0.4 or above are considered strong

Red depicts negative correlations

Green depicts positive correlations

Correlations with Policing Districts: Again since correlations of 0.4 are considered relatively strong, the figures below do not demonstrate a very strong relationship between Police District and confidence measures. There are however a few observations that can be made. There is a negative correlation, albeit weak across all measures of confidence and those living in District A while the correlation between those living in District and all measures is again weak but positive. Correlations for other districts vary between positive and negative across the different measures however for many the correlations are almost non-existent

	The local police in your area can be relied on to be there when you need them	The local police in your area would treat you with respect if you had contact with them	The local police in your area treat everyone fairly regardless of who they are	The local police in your area can be relied on to deal with minor crimes	The local police in your area understand the issues that affect this community	The local police in your area are dealing with the things that matter to this community	I have confidence in the police in this area

Correlations of 0.4 or above are considered strong

Red depicts negative correlations

Green depicts positive correlations

Correlations with Demographics: There is evidence of a positive, but not very strong, correlation between social classes ABC1 and all measures while the correlation was negative for those in socio-economic groups C2 and DE. The correlations across all measures are negative, and generally stronger amongst Catholics while that for Protestants are largely positive, as for those not stating they are Protestant or Catholic who have positive correlations with all measures.

Conclusions

 MillwardBrownUlster

Conclusions

- A link certainly exists between deprivation and confidence in police, however correlation analysis demonstrates that the link is not very strong. It does however appear to be more definitive when comparing those in the most deprived (deciles 1 & 2) and the least deprived areas (decile 10), with those in the most deprived decile having a negative correlation across all measures of confidence while those in the least deprived decile having an equally positive correlation.
- There appears to little or no consistent linear correlation between the measures and the deprivation deciles in between the outer extreme deciles. Correlations are mostly positive though, albeit weak between confidence and those in lesser deprived deciles 5 and above while but mostly negative for those in deprivation deciles 4 and below. However, while the strongest positive correlations do exist between confidence and decile 10, it is decile 6 that generally has the second most positive correlation.

Conclusions

- Correlations are generally weak but mostly positive between the measures and those in socio-economic groups ABC1, Protestants, those neither Protestant or Catholic, those aged over 65, females and those living in Districts B (South & East Belfast) and District C (Castlereagh/North Down/Ards/Down).
- On the other hand correlations, again relatively weak, are generally negative amongst males, those living in District A (North & West Belfast), those in socio-economic groups C2 and DE, Catholics, and those under 25.

 MillwardBrownUlster

Millward Brown Ulster Omnibus Survey

- The Millward Brown Ulster Omnibus Survey is a twice monthly face-to-face survey conducted amongst a representative sample of the Northern Ireland population.
- This research was conducted over three consecutive waves of the Millward Brown Ulster Omnibus Survey.
- Each survey consists of a freshly drawn sample of 1000 adults aged 16+, with a total sample for this research of 3054.
- The sample is quota controlled to represent the Northern Ireland population in terms of sex, age and social class.
- For each Omnibus Survey 45 sampling points (spread over 80 electoral wards) are drawn using a stratified random sampling method to ensure that the sample is representative in terms of region, hence there were a total of 135 sampling points used for this research.
- This sample is very large and hence allows for analysis by a range of sex, age, social class, religion and regional groupings.
- All questions included on the Omnibus Survey are confidential to each individual participating client as is the resulting data. While the cost of recruiting a representative sample and collecting a full range of demographic details such as working and marital status, household size, presence and age of children in the household, disability, car in household and tenure is shared by all the participating clients.
- Postcodes are collected hence enabling further analysis by location.

Millward Brown Ulster Omnibus Survey

The Millward Brown Ulster Omnibus Survey, after the initial random selection of sampling points, is based on a quota sampling methodology. The sampling points are drawn from the Millward Brown Ulster Sampling Frame which is based on electoral wards in Northern Ireland, utilising a 2-stage stratification procedure, involving firstly a regional segmentation into 13 areas comprising geographic groupings of Local Government Districts, and secondly, an urban / rural classification based on electoral density. Electoral wards are then clustered into points of approximately equal electoral population taking into account the following requirements:

- Wards within each point are contiguous;
- Points are exclusively urban or rural;
- Wards within a point are broadly homogenous in population structure.

Taking into account the most recent boundary changes, the Millward Brown Ulster Northern Ireland Sampling Frame now comprises over 300 sampling points. In drawing points from this Sampling Frame, random procedures are adopted, points being selected with probability proportional to population within each of the 13 areas, depending on specific requirements. This sampling procedure is followed for most face to face surveys amongst the general public up to this point. The sampling procedure then continues according to the type required for each project, frequently quota based sampling which is utilised for the Omnibus Survey.

Strict quotas on gender, age and social class are put in place and must be adhered to, thus minimizing bias and ensuring the sample is representative. Part of interviewing training comprises guidance and instruction on respondent selection and recruitment in order to ensure that the resulting samples are as robust, inclusive and transparent as possible.

Sampling for the Millward Brown Ulster Omnibus Survey has always been very strict in nature. Each interviewer is issued with an interlocking sample that they must adhere to. This interlocking quota ensures that age and social class are represented within both males and females.

Questionnaire

SHOWSCREEN

Q.1 To what extent do you agree or disagree that the local police in your area can be relied on to be there when you need them?

Q.2 To what extent do you agree or disagree that the local police in your area would treat you with respect if you had contact with them?

Q.3 To what extent do you agree or disagree that the local police in your area treat everyone fairly regardless of who they are?

Q.4 To what extent do you agree or disagree that the local police in your area can be relied on to deal with minor crimes?

Q.5 To what extent do you agree or disagree that the local police in your area understand the issues that affect this community?

Q.6 To what extent do you agree or disagree that the local police in your area are dealing with the things that matter to this community

Q.7 Taking everything into account, I have confidence in the police in this area ...

Strongly agree

Tend to agree

Neither agree nor disagree

Tend to disagree
